Every animal deserves a second chance.

We're a volunteer-run rescue in Cedar Falls that has placed more than 1,400 dogs, cats, and small animals into permanent homes since 2011. Every adoptable animal lives in a foster home — not a cage — so we can tell you exactly who you're bringing home.

Meet the animals

Waiting for a home

All adoptions include spay/neuter, vaccinations, microchip, and two weeks of follow-up support. Adoption fees: dogs \$175, cats \$95, small animals \$40.

Clover

Rabbit - 1 year old - litter-trained -
bonded pair optional

A lop-eared gray rabbit who flops over the moment you scratch behind her ears. Clover is litter-trained, loves cilantro, and can be adopted with her brother Basil at no extra fee.

Ask about Clover

Get involved

We have no paid staff and no kennel building — this rescue runs entirely on neighbors who show up. Even one hour a week makes a real difference.

- Foster a dog, cat, or rabbit for two to eight weeks
- Walk dogs at our Saturday adoption events
- Drive animals to vet appointments
- Sort donations at the supply shed on Birch Road

Email volunteer@secondchancecf.example and we'll find the right job for you.

Adoption inquiry

Tell us a little about yourself and the animal you're interested in. We answer every inquiry within two days.

Full name	Phone
Email	
Which animal are you interested in?	
Biscuit (dog) ▼	
Tell us about your home	
☐ I understand that adopting includes a brief home visit and a follow-up call from a Second Chance volunteer.	
Send Inquiry	

\$20 feeds a foster animal for a week.

Second Chance is a registered 501(c)(3), and every dollar goes to food, vet care, and transport — our volunteers even buy their own coffee.

After

1. The "Donate" call-to-action in the yellow donate band doesn't lead anywhere donation-related — it points to #inquiry, the same "Adoption inquiry" contact form used by "Meet the animals"

The following items need a human decision; each comes with a drafted fix.

and "Ask about Biscuit/Luna/Clover". That form has no donation amount field, no payment step, and no mention of donating. A user who activates "Donate" (via mouse, keyboard, or screen reader) lands on an unrelated adoption-inquiry form with zero indication their intended action (giving money) is even possible there. This is a link-purpose/expected-behavior mismatch that a scanner cannot detect because the link has perfectly valid, non-empty text — the problem is semantic, not structural.

Page: `index.html` WCAG: 2.4.4 Link Purpose (In Context)

Where: `.donate-band a.btn (text "Donate", href="#inquiry")` **confidence: medium**

Proposed fix:

Either (a) point `href="#inquiry"` to a real donation page/payment processor (e.g. a hosted Stripe/PayPal/GiveButter donate page) if one exists, or (b) if donations are meant to go through this same contact form, relabel the section/form so the mismatch is honest, e.g. add a short line above the submit button or a dedicated donate form: `'<a class="btn" href="https://givebutter.com/secondchancecf" target="_blank" rel="noopener">Donate</a>'`. This needs a human decision because it depends on whether the rescue actually has a donation processor set up — I can't guess the real URL.

2. The "Full name", "Phone", and "Email" inputs have no ``autocomplete`` attribute. Axe's `autocomplete-valid` rule only flags an `*invalid*` `autocomplete` value — it does not require one to be present, so this passes automated scanning even though the inputs clearly map to standard personal-information fields. Without it, browser/AT autofill and personalization features (used heavily by people with motor or cognitive disabilities to avoid retyping this exact kind of data) don't kick in for this form.

Page: `index.html` WCAG: 1.3.5 Identify Input Purpose (AA)

Where: `#name, #phone, #email` inputs in `.inquiry-panel` form **confidence: high**

Proposed fix:

Add matching `autocomplete` attributes:

```
<input type="text" id="name" name="name" autocomplete="name">  
<input type="tel" id="phone" name="phone" autocomplete="tel">  
<input type="email" id="email" name="email" autocomplete="email">
```

Site-wide conventions applied

Decisions recorded once and applied consistently across every page:

Decision	Value	Rationale
<code>landmark:donate-band</code>	Moved <code>.donate-band</code> div inside <code><main></code> , right after the last <code><section></code> , instead of leaving it as a sibling between <code></main></code> and <code><footer></code> .	The donate call-to-action is part of the primary page content, not header/footer chrome, so it belongs inside the main landmark to satisfy the 'region' rule without altering visual layout or content order.
<code>alt-style:pet-avatar-illustrations</code>	"Cartoon portrait of [Name], a [color/notable feature] [species] [wearing a [color] collar, if present]"	Pet card images are decorative-illustration avatars carrying identity info not otherwise stated (color, breed cues, collar); concise consistent phrasing avoids redundant 'image of' and matches the informative-image style used across the adoption grid.
<code>label-style:field-name-div-to-label</code>	Converted <code>` .field-name`</code> divs into <code><label class="field-name" for="...">`</code> elements associated via id, rather than adding aria-label, to preserve visible styling and satisfy WCAG 3.3.2.	Nearby text already visually served as a label; converting it to a real <code><label></code> keeps the design identical while fixing the missing accessible name.
<code>widget:consent-checkbox-div-to-input</code>	Replaced <code><div class="consent" role="checkbox" tabindex="0">...</div>`</code> with a native <code><input type="checkbox" id="consent" class="box"><label for="consent">...</label>`</code> pair, restyled via CSS (<code>appearance:none</code> on <code>.box</code> , <code>.consent</code> label overrides for font-weight/size/color) to preserve the original visual appearance exactly.	The page has no JavaScript, so the fake <code>role="checkbox"</code> div had no keyboard/state behavior to preserve; per guidance the native element is the correct fix over patching in <code>aria-checked</code> , and it also gives real keyboard/form functionality that was previously missing entirely.
<code>color:#8ab98f-on-#ffffff</code>	replace foreground with <code>#4e8254</code>	Original brand green <code>#8ab98f</code> on white only achieved 2.23:1 contrast for the <code>.pet-age</code> text; darkening to <code>#4e8254</code> (same hue, deltaL 0.225) reaches 4.52:1, meeting WCAG AA 4.5:1 for normal text while preserving the brand green look.

How these results were verified

Every fix in this report survived three independent checks, none of which rely on the AI that wrote the fix:

1. **Re-scan:** the page was re-tested with axe-core (the industry-standard accessibility engine) — the violation had to be gone, with zero new violations anywhere on the page.
2. **Content integrity:** the page's visible text and images were compared word-by-word and element-by-element against the original — nothing may disappear.
3. **Visual comparison:** before/after screenshots were diffed pixel-by-pixel; changes must stay inside the elements each fix was allowed to touch (a contrast fix may recolor its own text — nothing else).

Fixes that failed any check were automatically rolled back and routed to the review queue above.

Honest scope

Automated scanners detect roughly half of accessibility issues by volume (Deque's coverage study: 57%). This report therefore makes two kinds of claims: **verified fixes** for everything the scanner can measure, and **expert-drafted proposals** — the review items above — for what requires human judgment. No tool can truthfully promise "full compliance" from automation alone; the ones that did got sued and fined. StepFree's promise is narrower and real: the detectable layer fixed and proven, the judgment layer drafted and routed to you.

Recommended next steps

Review the queued items, then deploy the fixed files from the working copy.

Generated by StepFree — the accessibility engineer that fixes your code and proves it. Scan engine: axe-core (Deque Systems). Conformance target: WCAG 2.2 A/AA. This report describes automated testing results and is not legal advice.
